

Grease Trap Meister

Equipment + dedicated bioformulation + operating conditions

EN SALES GUIDE

COMMERCIAL CONDITIONS

MEISTER-led overseas installation is generally planned from 50 units. Equipment supply starts from one unit when the customer or local partner installs it to the agreed requirements.

POWER AND INSTALLATION

The standard equipment is 100 V. The customer must provide an appropriate transformer and confirm voltage, frequency, grounding and local electrical safety.

BIOFORMULATION

Dedicated bioformulation is supplied in large containers after consultation. Five-fold dilution is an initial discussion reference, not a universal fixed setting.

ONE SYSTEM

Aeration, timed operation, circulation and the dedicated bioformulation work as one system. Copying the machine alone does not reproduce the combined operating process.

IMPORTANT

Results vary with grease load, detergents, temperature, tank design, aeration, operating time and maintenance. This system does not replace legally required inspection, cleaning or waste handling.
